ABSTRACT FROM MEDICAL RECORD

To Whom It May Concern:

RE: Patient: V.V. Kochnev

Complaints of weakness in the legs, periodic pains in the loin, right leg, posterior surface of the left hip. The patient has been ill since 1995 after a severe vertebro-medullary injury; osteomyelitis of the left heel bone.

The patient is sociable, oriented in time and space; flail legs; breech, thigh and talocrural muscular hypotonia and hypotrophy. Muscle strength is lowered: in extensor muscle of the right foot - down to 0, of the left foot - down to 1; flexor muscle of the right crus - down to 1-1.5, of the hips - down to 1-2. Conductor-type hyposthesia from D11 on the left, L1 on the right. Knee and heel tendon reflexes are not working. Abdominal reflexes are absent. No abnormalities on the part of craniocerebral nerves have been detected. Muscle strength in the arms is good; finger-nose test is good.

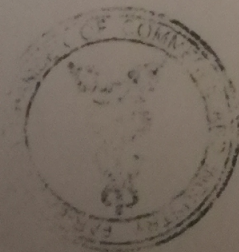

Diagnosis: Residual signs of a severe vertebro-medullary injury after compression fracture of D12, L1, L2 bodies (1995). Condition after L2 laminectomy, removal of bone fragments from the canal of spinal cord, circular extradural hemorrhage, prolapsed L1, L2 discs, duraplasty and posterior spine fusion of D11 - L3, L4 laminae with metal devices. Syndromes of flail legs and pelvic dysfunction (incontinence). Condition after osteomyelitis of the left heel bone with the left leg getting 3-cm shorter.

Neurologist:
